

ROLE OF ICT IN ENHANCING THE PERFORMANCE OF THE TEACHING STAFF IN HIGHER INSTITUTIONS IN SUDAN UNIVERSITY OF BAHRI AS A CASE STUDY

Hashim Abdelgadir Elbakhit Ahmed

Ph.D., Faculty of Education University of Bahri- Sudan, hashim623@yahoo.com

Abstract

Information and communication technologies (ICT) can be used to support and enhance teaching and learning process. The following ICT tools: computer, video conference, projector, mic and other technologies have been used in classrooms. These tools deliver different types of contents and serve various purposes in the lecture hall. This empirical research aims at finding out (a) the real situation of ICT used in the higher institutions in Sudan. (b) to explore solutions to overcome challenges of ICT use (c) come up with specific recommendations can be generalized to all universities throughout the country in regard to ICT use. Structured questionnaire was designed to obtain primary data, in addition to secondary data collected from references and internet. It presents results of a survey to a number of 74 of teaching staff representing eight faculties at University of Bahri - Sudan. The findings of this study revealed that teaching staff had a strong willingness to integrate ICT into teaching-learning processes. The innovations that ICT has brought in teaching and learning process come through presentation via computer (PPT), video conference, social networks, e-courses, internet, email to communicate with students. Moreover, the existence of all these media increased the opportunity to excellent practice of teaching-learning process. The study introduced the following recommendations; equipping the lecture halls with the suitable digital equipment to enable teaching and learning with computer programs, developing new curricula for applying the ICT as presentation tools, encouraging for ICT use by teaching staff accompanied by training and capacity development, integrating the ICT use into the university strategy, and finally transformation of positive attitudes towards ICT into effective practice.

Keywords: ICT, Enhancing, Teaching-Learning, Teaching Staff.

1. INTRODUCTION

The use of ICT in education is covering behind expectation and desire. The role of ICT can support this process which focuses on capacity building of teacher. Guma, et al.(2013) argue that, the use of ICT in the classroom teaching-learning is very important for it provides opportunities for teachers and students to operate, store, use, and retrieve information, encourage independent and active learning, and self-responsibility for learning such as distance learning, motivate teachers and students to continue using learning outside school hours, plan and

prepare lessons and design materials such as course content delivery and facilitate sharing of resources. The nature and extent to which ICT is being used in education is considered to be vital. In spite of all efforts made, the use of ICT in higher education institutions (HEIs) in general is poor. (Smeets, et al. 1999) stated that high expectations with regard to the potential of computer in education have not been met. Initially, attempts to introduce the computer in education were technology-centred, the role of the teacher in the innovation process being ignored. These innovators tended to view teachers as organisers of prescribed tasks, indicating that detailed tasks had to be formulated in order to get teachers to use computer in the classroom.

University of Bahri is considered one of the newest universities in Sudan was established in July 2011 to accommodate northern Sudanese citizens who were working and/or studying in the former southern national universities, following the separation of South Sudan from the North to form an independent Country. The University of Bahri is built on a strong foundation of academic excellence and relevance through highly experienced academic and supporting staffs, therefore it looks to be a leader in higher education inside and outside the Sudan, particularly in the field of integration the ICT into learning and teaching process.

2. OBJECTIVES

The specific objectives of the study are to: □

1. Determine factors influencing use of ICT to make teaching-learning effective in higher institutions in Sudan. □
2. Identify the situation of using ICT in teaching-learning process among the academic staff of University of Bahri.
3. Come up with recommendations can be generalize throughout the higher education institutions in Sudan regarding to the ICT use.

3. RESEARCH QUESTIONS

1. Do you use the computer for presentation in teaching process?
2. Do you use information and communication technology (ICT) in the teaching and learning process?
3. If yes, please rank the following tools according to use?
Websites () social networks () projector () email () forums () chat () WhatsApp ()
E- Courses ()
4. Do you think that, the use of ICT enhances the teaching and learning process?

4. DEFINITION OF ICTS

ICT is a broad term referring to technologies which are being used for collecting, storing, editing and passing on information in various forms. Computer is the best known example of the use of ICT in education, but the term multimedia is also frequently used. Multimedia can be interpreted as a combination of data carriers, for example video, CD-ROM, DVD and internet and software in which the possibility for an interactive approach is offered (Smeets, 1996). Recently, ICT definition became more broadly used as Fong (2006) who explained that information and communication technology (ICT) is an umbrella term that includes any communication device or application, encompassing: radio, television, cellular phones, computer and network hardware and software, satellite systems and so on. In the context of (ICTs), virtually it deals with the software applications and computer hardware, and no doubt it became an essential part of the world of work in today's world. Derek, (2008) assumed that a modern labour market is almost unthinkable without ICT, digital literacy is increasingly considered as an essential competence.

5. ICT IN SUDAN

Sudan like other developing countries is still in the first steps of integrating ICT in teaching-learning process. Though it is limited by a number of obstacles. According to Hamdy 2007, in last two decades, Sudan's experience in building and capitalizing on ICT as gateway for custom development is bend mark in the country's history. The institutional, legal and regulatory framework was formed to advance ICT as a strategy for integrating the economy into the global market. The Sudanese national ICT strategy was formulated in the year 1999. This strategy focuses on five major areas, namely; technology infrastructure, human resource development, software industry development, content (primarily in Arabic), and geo-information (Hamdy

2007). The national policy encourages the use of ICT in developing local policies to ensure the complete integration of ICT in education and training on all levels, including the development of school curricula, teacher training, and managing and organizing educational institutions (Abdelrahman, 2009). The ICT policy for education was launched in 2002. In 2004, ICT was introduced in secondary education curricula. A number of computers were installed in schools (around 50% of secondary schools), at an average of 10 computers per school. In schools the connectivity is mainly through dial-up and Asymmetric Digital Subscriber Line (ADSL). However, in higher education systems, it is through ADSL only. The country is planning to have computers available in all education levels by the year 2015 as agreed to at the ICT summit in Geneva. The ICT curriculum has been introduced at Grade 4. The teachers have been trained on the basics of ICT. Both the government and the private sector provide access to the internet as a learning resource (Hamdy 2007). The Ministry of Education has started providing schools and teachers' institutes with computers. An order to import 10,000 or more computers has been placed to provide the rest of the educational institutions with computers. There is an initiative for developing an educational management information system. The government has opened up competitive investments in telecommunication. Licensing was granted for newcomers employing advanced technologies, which are hoped to increase the spread of and access to ICT and make products affordable. Although there is an open market in internet service provision (El-Tigani, 2010). There is only one Internet Service Provider (ISP) - Sudanet¹. It is planning to open Internet cafes in Khartoum. Development in ICT in Sudan is evident in a substantial expansion of infrastructure and capital investment including management systems and human capital (Elamin, 2004). According to Fatima, (2009) there are many constrains that hinder the best implementation of ICT throughout the country in spite of the promising efforts and policies made by the government and other bodies such as: Outreach to rural and remote areas still poses a considerable challenge. Poverty, lack of resources, and political unrest puts ICT lower on the priority list of basic needs in most areas of Sudan, civil war hinder nationwide implementation and financing and donor interest in Sudan remains limited, especially with the number of restrictions that were imposed.

6. OVERVIEW OF ICT IN SUDANESE HIGHER EDUCATION INSTITUTIONS

The interest over training in ICTs has increased during the previous years to benefit from the development of these new technologies in teaching and lecturing. Accordingly, the demand on ICT training, design of the education system and all aspects of this global attitude have increased in Sudanese universities. Many studies recommend the introduction of ICTs to the higher education institutions (HEIs) in Sudan. In this regard, Nour (2011) argued that introduction of ICTs to HEIs is a very necessary requirement to achieve many objectives such as teaching staff and research environment development, a method to raise education quality and international standard in competitive world. He emphasized that the ICT has also the potential to support scientific research activities, improve the ways of acquisition of knowledge, and support the restructuring of administration and modernization of Sudanese universities. In the Sudanese HEIs utilization of ICTs has proceeded rapidly in the past decade. Therefore, all the universities have Internet work services and connected together in one intranet. Hamdy, 2007, stated that the World Bank recommends that the HEIs in Sudan, particularly specialized universities and colleges, have to use non-traditional higher education infrastructures with a view of availing more efficient modes of teaching and learning. But still there are many infrastructural, organizational and personal challenges and problems facing the use of ICTs. These obstacles found to be the lack of proximity to ICT facilities at the workplace and poor electricity supply, lack of funding, lack of university administrative support and low opportunities for training and lack of skilled and trained staff in using ICT tools. As Suliman et al., 2008 confirmed that the staff development program in Sudanese higher education is proposed to improve the ability of the teaching force and to provide them with new skills and teaching methods, pedagogy and psychology, application of teaching aids and the use of instructional Computers and Internet technologies. Nour Eldin et al. 2012 emphasized that despite the growing in the area of knowledge based systems, it is not known why the implementation of ICTs is still very low in Sudanese higher education's institutions.

7. METHODOLOGY AND PARTICIPANTS

Descriptive method and quantitative analysis of data were used in the study. The target sample of the study was 74 teachers. The sample was selected using stratified random sampling technique from eight faculties (see the table.1. below). This research depended on primary data collected through a structured questionnaire prepared by the author to obtain information from a large group of staff in university of Bahri during the first semester of academic year 2015-2016. Beside the secondary data which is collected from

¹ banners.noticiasdot.com/termometro/.../aisi/.../aisi_sudan.pdf

internet, reports, and literature.

Table1: Status of Respondents by Faculty (N=74)

No.	Name of Faculty	Respondents	%
1	Education	15	20.3
2	Arts and Humanities	8	10.8
3	Law	9	12.2
4	Applied Sciences	12	16.1
5	Natural Resources	8	10.8
6	Animal Product	6	8.1
7	Agriculture	7	9.5
8	Engineering	9	12.2
Total		74	100

8. DATA ANALYSIS

The collected data is coded, entered into the computer and analysed using the Statistical Package for Social Sciences (SPSS) for Windows, version 16 and Excel program. Quantitative approach was used to answer the question about the use of the ICT in the lecture halls in Bahri University. Descriptive statistics are used to find out the distributions of respondents in the different categories. Tables and figures of frequencies and percentages are prepared.

Results and Discussion:

Results of this study are interpreted using descriptive statistics (frequencies and percentages) so as to give general overview of using ICT by the teachers in university of Bahri - Sudan.

Table 2: Status of Respondents by Gender and Age (N=74)

Gender				Age					
Male		Female		20-39		40-59		60 – Over	
N	%	N	%	N	%	N	%	N	%
45	60.8	29	39.2	40	54.1	31	41.8	3	4.1

According to table 2 above, the results indicate that the majority of respondents were males (60.8%). Also most of the respondents could be classified as young group of range of age (20-39 years) with a percentage 54.1%. This situation means all of them and the next group (40-59) is familiar with using different kind of technologies as shown at figure.1 below.

Table 3: Status of Respondents by Job Title (N=74)

Title	Frequency	%
Lecturer	28	37.8
Assistant-Prof	29	39.2
Associate-Prof	11	14.9
Professor	6	8.1
Total	74	100.0

Table.3 above indicates that all types of teaching staff (professor, associate-professor, assistant-professor, and lecturer) were participated to this study. The majority was the assistant-professor group (39.2%) and lecturers group (37.8%). Such two groups are representing the common condition or the starting grade to academic staff in the university. The last two groups: *associate professor and professor* require specific

criteria to reach, so they are minority as normal condition.

Table 4: Number of Students in Classroom taught by Respondents

Students	Frequency	%
Less than 50	14	18.9
50 to 100	9	12.2
100 to 150	6	8.1
150 to 200	9	12.2
Over 200	36	48.6
Total	74	100.0

Table 4 above showed that the bulk of the respondents (48.6%) deals with a number of more than 200 students inside the classroom, such situation needs non-traditional means to teach, in another meaning, the blackboard or whiteboard is not the essential educational aids in the teaching and learning process, in addition the teacher will needs to use other tools like projector, LCDS mic...etc. Moreover 18.9% of the respondents deal with less than 50 students in classroom; those might use traditional or non-traditional tools.

9. INTEGRATION OF ICT IN LEARNING/TEACHING PROCESS

Table 5: Respondent’s Ratings of using ICT in teaching & Learning Process (N=74)

No.	Variables	Yes	No	I don’t know	Total
1	Do you use computer for presentation in the teaching process?	64 86.5 %	10 13.5 %	–	74 100.0 %
2	Do you use ICT in teaching and learning process?	57 77.0 %	17 23.0 %	–	74 100.0 %
3	Do you think that the use of ICT enhances the teaching and learning process?	73 98.6 %	–	1 1.4 %	74 100.0 %

According to table 5 above, 86.5% of the respondents confirmed they use the computer in presenting their lectures, while 13.5% were not. When they were asked of using the information and communication technology which is detailed in figure 1 below in teaching and learning process, 77.0% of the respondents rated: Yes, this means they prepare lessons in PPT format and browsing internet to increase knowledge and communicate with their students by email, WhatsApp...etc. The respondents who rated: No, some of them mostly belong to group 2 and group 3 of age (40-59) & (60 – Over), they do not use computer in preparing lesson and only use the black or whiteboard in the teaching and learning process. But when the respondents were asked about (*Do you think that the use of ICT enhances the teaching and learning process?*), about 98.6 % rated Yes: that means they emphasized the importance of using the ICT in enhancing the teaching and learning process, even those who have no relationship with computer and other ICT technology. Only one respondent said there is no impact of using ICT in enhancing the teaching and learning process.

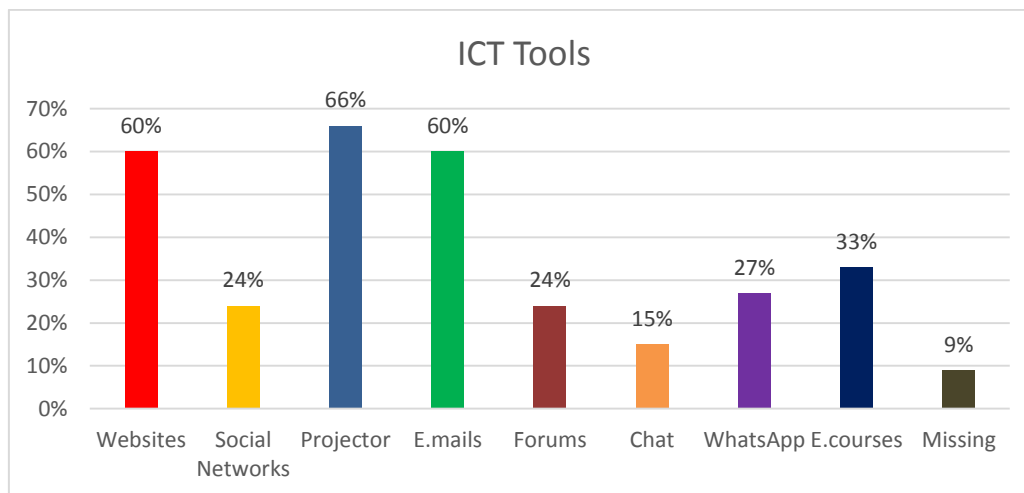

Fig.1.Rank of using ICT tools by Respondents

Figure 1 over shows the preference of using the ICT tools by the academic staff in the university of Bahri-Sudan, where 66% of the respondents use the projector in presenting lessons, while 60 % browsing the internet using relevant websites to their fields, whereas the same percentage uses emails for different purposes, although respondents use various forms of ICTs to communicate with others inside the Sudan and worldwide.

10. CONCLUSION

The rapid development in ICT has brought significant changes in the twenty-first century, as well as affected its adoption and integration by teaching staff in teaching-learning process. The effective integration of technology into classroom practices poses a challenge to teaching staff. The findings of this study indicate that teaching staff have solid desire for the integration of ICT into education but they encountered by many obstacles such as technical problems related to electricity and disadvantage of projector devices, illiteracy of some academic staff concerning the dealing with computer and some software like power point and statistics programs and finally some old generation of teachers resist using the ICT in teaching process. These findings therefore have implications for encouraging teachers to use of ICT especially the old individuals focusing on obtaining basic ICT skills.

11. RECOMMENDATIONS

The use of the new technology for education has become well-recognized world-wide, and from now on all aspects of life could be unthinkable without ICT. There is an international consensus that the use of computer in teaching-learning process has grown more diversified as educators recognize the potential of learning with technology as a tool for enhancing students' capabilities.

University of Bahri as a new established university in Sudan is still facing great challenges, and in particular, the adoptions of new technology into the teaching process. This challenge requires equipping the lecture halls with the suitable computer equipment to enabling teaching and learning in computer programs, developing new curricula and using ICT as presentation tools, motivation and rewarding teaching staff to use ICT, Integrating the ICT into the university strategy, and finally transformation of positive attitudes towards ICT into effective practice.
